

U10 Exercises TC1 - Stored Procedures

To do this exercise you have to know the schemas of the database Movies8 used in the previous units.

For each exercise we will create a script which includes the creation of the procedure and the test to ensure that it works as expected. Making sure that the script works every time that we run it, and not only the first time.

1. Create a stored procedure called Ex1, to list all of the data for films released between two given dates.
2. Create a stored procedure called Ex2, which returns the number of films released in a specific century.
3. Create a stored procedure called Ex3, which creates a new table called JapaneseFilms with all the films recorded in Japanese and directed by a specific director. The procedure must return how many films have been inserted.
4. Create a stored procedure called Ex4, similar to the previous one but now the language can be any and the name of the table will be xxxFilms where xxx is the chosen language.
