DDL. Data Definition Language - Test your skills

To do this exercise you have to know the schemas of the databases Movies and Movies8 used in the previous units.

1. Write a script that contains the SQL sentences for creating a new database named MoviesNew that will have the same schema as the database Movies.
    Make sure that your script works every time that you run it, and not only the first time.
    If the database that you are creating already exists, get rid of it!

2. Create a script to change the definition of MoviesNew so that it has the same schema as Movies8.

3. We are told that the film release date is frequently used to order the films in queries.
    What would you do in order to speed these queries up?
    Write the corresponding sentence.

In the portal you have a wiki in which you can discuss your solutions.
